

Forklift Fork Positioner

Forklift Fork Positioners - The fork positioner is a hydraulic device which could allow the the one driving to be able to operate the lift truck without leaving the seat. They are constructed out of top quality materials and are designed to withstand the most challenging operations and work environments. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more accurate carrying and placement in a faster and much more effective way.

The fork pocket is somewhat unique and enables the person operating it to safely swing the blades into position without any worry of damaging the positioning cylinders. This allows the operator the choice to execute simultaneous or independent fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into fork positioners on existing units.
